How to create an apkg-file

The apkg-file is created using a Python script which can be found on github page here: https://github.com/antonkarl/iceFlash4K/blob/main/scripts/gen_deck_en_new.py. Remember to change the location of files needed, that is the dataset file and mp3 files. For new language version, change the template files accordingly.

Account on Ankiweb

After the apkg-file is created. Follow the following steps to open it on Anki and share it on Ankiweb.

- Download Anki app here: <https://apps.ankiweb.net>
- Create an apkg-file which contains an Anki deck.
- Open the apkg-file on Anki.
- Log into Anki account. All the flashcard decks are shared to Ankiweb through Máltaekni email account: maltaekni@hi.is, pw: iceFlash4000.
- Click sync to sync decks to Ankiweb automatically.
- On Ankiweb, log into the account and choose “My Shared Items” to see all the shared decks. Click “Actions” and then “share” to share an updated version of an already shared deck or share a new deck to Ankiweb.
- Information needed during the share process can be found in **anki_description.txt** file.
